

optomap® Retinal Exam

When compared to all methods of examining the retinal surface, our experience has been that the Optomap gives us the most complete view of the inside of the eye. This provides early detection for diseases that affect not just your eyes, but your overall health.

Because dilating drops are usually not required for this procedure, the Optomap is quick and convenient.

iVue®

While the Optomap goes broad, the iVue goes deep. Some problems are visible on the surface of the retina and others exist underneath it.

iVue is a fast and easy optical CT imaging system that lets us look within and below your retina to find early damage from diseases like macular degeneration, glaucoma and diabetes before they can impact your vision.

QuantifEye® MPS II

The QuantifEye MPS II instrument is the most reliable and accurate device for measuring Macular Pigment Optical Density (MPOD). Your MPOD allows us to assess for low macular pigment, a key risk factor in the development of macular degeneration and visual performance challenges such as night driving problems.

The primary benefits of MPOD measurement are identifying which patients need supplementation and confirming that vitamin supplementation is working.

iWellness \$47

We have paired the Optomap (\$34), iVue (\$49), and MPOD (\$32) technologies into a single screening package for an exceptional experience. Knowing first hand the devastating effects that vision loss has on an individual, it is our professional opinion that all patients should receive the iWellness Screening at every comprehensive examination.
